Instrumentation & Control Process Control Fundamentals

In almost all industrial process applications, control of process variables is critical to the safe and efficient operation of the process. The most common variables controlled are pressure, level, temperature, and flow. Even though there are many different methods used to control these processes, this monitoring and control is generically called process control.

The control of processes is one of the main branches of applied instrumentation. Control instrumentation includes devices such as solenoids, valves, circuit breakers, and relays. These devices are able to change a field parameter, and provide remote or automated control capabilities. Transmitters are devices which produce an analog signal, usually in the form of a 4:20 ma electrical current signal, although many other options using voltage,frequency, or pressure are possible.
