A jigs and fixtures are the devices which help in increasing the rate of identical parts and reducing the human efforts required for producing these parts, It has already been emphasized earlier that a center lathe is a suitable machine tool for producing individual parts of different shapes and sizes, but for producing similar articles in great number its use will not be economical.

*Jigs and Fixtures: Types, Parts, Definition, Applications ...*

Two main intentions of when placing a job on a jig/fixture are: Precisely positioning the part at the desired coordinates. Curbing all six degrees of movement so that the part cannot budge. An extensively used method for obtaining these objectives is known as the 3-2-1 principle or six degrees of freedom for part location.

*Design principles of Jigs and Fixtures*

Jig and fixture design is based upon a number of fundamental principles but there are no hard and fast rules. The jig tool designer is likely to meet a new problem on almost every component he handles, but the underlying principles will be found to be similar.

*Jigs and Fixtures: Elements and Design Steps | Machine ...*

The principle of location or the 3-2-1 principle, CAD tools (like ProE), and FEA tools (like ANSYS) are used for the design of the jigs as well as the fixtures. The jig is used for guiding the cutting tool (like a drill bit), and for doing so, jigs have components like a bush, which comes in contact with the cutting tool.

*Jigs and Fixtures: Definition, Types, Differences ...*

The most common type of jig is the drill jig, which guides the drill bit for creating holes at desired locations. Using of drill jigs increases production rate drastically by eliminating the time spent using a square scribe, height gauge, center punch, etc. The fixture is the tool which holds the work piece with the machine bed precisely at the desired location.

## *Introduction to JIGS AND FIXTURES*

According to Pachbhai and Raut (2014), the design of Jigs and fixtures depend on the following factors: workpiece and finished component size and geometry study, the machine size and capacity, the machine's extent of automation, availability of clamping arrangement and locating devices in the machine, the accuracy of the available indexing devices, the machine tools rigidity, the needed accuracy level in the quality of work to be produced, etc.

## *The Design and Need for Jigs and Fixtures in Manufacturing ...*

A fixture differs from a jig in that when a fixture is used the tool must move relative to the workpiece whereas a jig moves the piece while the tool remains stationary. Fixtures are used in multidimensional machining i.e milling, planning, slotting, turning, grinding and shaping tools etc. it is also used for assembling and inspection jobs.
