Microprocessor-based digital protection relays now emulate the original devices, as well as providing types of protection and supervision impractical with electromechanical relays.

Electromechanical relays provide only rudimentary indication of the location and origin of a fault. In many cases a single microprocessor relay provides functions that would take two or more electromechanical devices. By combining several functions in one case, numerical relays also save capital cost and

The rating indicates the level of relay's capability to switch the load, including the inrush current. For example, relays for television power supplies need to obtain the TV rating. The switching test (durability test) of these relays is performed using a tungsten lamp as a load and must withstand in total 25,000 times of the durability test.
