The quantification of uncertainty in computational fluid dynamics (CFD) predictions is both a significant challenge and an important goal. Probabilistic uncertainty quantification (UQ) methods have been used to propagate uncertainty from model inputs to outputs when input uncertainties are large and have been characterized

The primary objective of the course is to introduce students to state-of-the-art methods for uncertainty propagation and quantification in model-based computations, focusing on the computational and algorithmic features of these methods most useful in dealing with systems specified in terms of stochastic ordinary and partial differential equations.

Uncertainty Quantification (UQ) is common practice for most fast running codes, which easily allow to run thousands of simulations. However, for computationally demanding codes, like often the case for Computational Fluid Dynamics (CFD) simulations, UQ is a challenge.

This book presents applications of spectral  
methods to problems of uncertainty  
propagation and quantification in model-based  
computations, focusing on the computational  
and algorithmic features of these methods  
most useful in dealing with models based on  
partial differential equations, in particular  
models arising in simulations of fluid flows.
